Peter,

Thanks for the suggestion. The input is appreciated.

We will collect a sample at Howardsville as part of our sampling run.

Pat

Larry – I would encourage Sunnyside to take a sample at the Howardsville gage as well.

I've attached an updated spreadsheet with sampling at A68 and Howardsville from last year. I calculated the percentage of metal load at A68 that is attributable from sources above the Howardsville gage. As you know, most of the metal load (zinc, cadmium, and manganese) at A68 comes in between Howardsville and A68 in March and April. This is when the highest metal concentrations are seen at A68. During the May – July timeframe, a higher percentage of loading comes from upstream of Howardsville as the snow melts at higher elevation.

When Sunnyside does its sampling, I think it's important to know if the sampling occurs when most of the loading is happening above or below Howardsville. Basically, which metal loading regime is currently occurring.

All-

For your information, I have attached sampling plan maps –Google Earth kmz file (if you have Google Earth) and Google image (if you don't) and a spreadsheet – Proposed Sample Locations for the high-flow surface water investigation that Sunnyside is planning to implement in May . Let me know if you have any questions.

Thanks
